

Green Tent

Competition Project:

Mobile Sustainable Dwelling

Client Ecoshack
Date Summer 2004
Services Architectural Competition

This competition called for the design of an environmentally sustainable and easily portable shelter for use in arid/desert conditions. Solearth's solution combined a low-tech structural element (or recycled bicycle tyres) with a high-tech tent fabric. Central to the design the use of a fabric based photovoltaic cell which could collect solar energy during the day for use at night.
